

Red-blue colorings of graphs

Bryan Freyberg*, University of Minnesota Duluth

Alison Marr, Southwestern University

A red-blue coloring of a graph is an assignment of a color, red or blue, to each vertex of the graph, such that every vertex has an equal number of red neighbors and blue neighbors. This is similar to the notion of cordial labeling, but as far as we know, we are the first to consider this problem. We present some preliminary results.

Keywords: vertex coloring, cordial labeling
