2-nearly Platonic graphs

Jiangyi Qiu*, University of Minnesota Duluth
Dalibor Froncek, University of Minnesota Duluth

A 2-nearly Platonic graph of type \((k, d)\) is a \(k\)-regular planar graph with all but two faces of the same degree \(d\). W. Keith, D. Fronce, and D. Kreher conjectured that those two exceptional faces must have the same size. In this talk, we will show an outline of the proof.

Keywords: Platonic solids, Platonic graphs, planar graphs
