Writable reals and ordinals

Definition

 $R \subseteq \omega$ is writable

if its characteristic function is on the output tape at the end of a halting computation.

(4回) (4回) (4回)

Writable reals and ordinals

Definition

 $R \subseteq \omega$ is writable

if its characteristic function is on the output tape at the end of a halting computation.

An ordinal α is writable

if some real coding α (via some standard representation) is writable.

A (1) < A (2) < A (2) </p>

Writable reals and ordinals

Definition

 $R \subseteq \omega$ is writable

if its characteristic function is on the output tape at the end of a halting computation.

An ordinal α is writable

if some real coding α (via some standard representation) is writable.

 $\lambda := \sup \{ \alpha \mid \alpha \text{ is writable} \}$

A (1) < A (2) < A (2) </p>

Writable reals and ordinals

Definition

 $R \subseteq \omega$ is writable

if its characteristic function is on the output tape at the end of a halting computation.

An ordinal α is writable

if some real coding α (via some standard representation) is writable.

 $\lambda := \sup \ \{ \alpha \mid \alpha \text{ is writable} \}$

Proposition

 $R \subseteq \omega$ is writable iff $R \in L_{\lambda}$.

- - E - F

Eventually writable reals and ordinals

Definition

$R \subseteq \omega$ is eventually writable

if its characteristic function is on the output tape, never to change, of a computation.

An ordinal α is eventually writable

if some real coding α (via some standard representation) is eventually writable.

$$\zeta := \sup \ \{ \alpha \mid \alpha \text{ is eventually writable} \}$$

Proposition

 $R \subseteq \omega$ is eventually writable iff $R \in L_{\zeta}$.

A (10) × (10) × (10) ×

Accidentally writable reals and ordinals

Definition

$R \subseteq \omega$ is accidentally writable

if its characteristic function is on the output tape at any time during a computation.

An ordinal α is **accidentally writable** if some real coding α (via some standard representation) is accidentally writable.

 $\mathbf{\Sigma} := \sup \ \{ \alpha \mid \alpha \text{ is accidentally writable} \}$

Proposition

 $R \subseteq \omega$ is accidentally writable iff $R \in L_{\Sigma}$.

A (10) × (10) × (10) ×

Summary and conclusions

 λ is the supremum of the writables. ζ is the supremum of the eventually writables. Σ is the supremum of the accidentally writables. Clearly, $\lambda \leq \zeta \leq \Sigma$.

< 回 > < 三 > < 三 >

Summary and conclusions

 λ is the supremum of the writables.

 $\boldsymbol{\zeta}$ is the supremum of the eventually writables.

 Σ is the supremum of the accidentally writables.

Clearly, $\lambda \leq \zeta \leq \Sigma$.

Theorem

(Welch) ζ is the least ordinal α such that L_{α} has a Σ_2 -elementary extension. (ζ is the least Σ_2 -extendible ordinal.) The ordinal of that extension is Σ . L_{λ} is the least Σ_1 -elementary substructure of L_{ζ} .

Time to iterate

Definition $0^{\bullet} = \{(e, x) | \phi_e(x) \downarrow \}$

Proposition

The definitions of λ, ζ , and Σ relativize (to $\lambda^{\blacktriangledown}, \zeta^{\blacktriangledown}$, and $\Sigma^{\blacktriangledown}$) to computations from 0^{\blacktriangledown} . Furthermore, $\zeta^{\blacktriangledown}$ is the least Σ_2 -extendible limit of Σ_2 -extendibles, the ordinal of its Σ_2 extension is $\Sigma^{\blacktriangledown}$, and $\lambda^{\blacktriangledown}$ is the ordinal of its least Σ_1 -elementary substructure.

Applications	Opti
Background	Opti
Iterations	Opti

Time to iterate

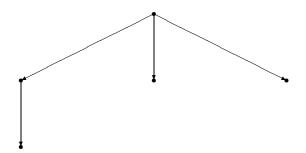

ITTMs with arbitrary iteration:

A computation may ask a convergence question about another computation. This can be considered calling a sub-computation. That sub-computation might do the same. This can continue, generating a tree of sub-computations. Eventually, perhaps, a computation is run which calls no sub-computation. This either converges or diverges. That answer is returned to its calling computation, which then continues.

Bad example

One can naturally define the course of a computation if and only if the tree of sub-computations is well-founded. How is this to be dealt with?

Option I Option II Option III

Option I

When the main computation makes a sub-call, the call must be made with an ordinal. When a sub-call makes a sub-call itself, that must be done with a smaller ordinal. The definitions of λ, ζ , and Σ relativize (to $\lambda^{it} \Psi, \zeta^{it} \Psi$, and $\Sigma^{it} \Psi$).

Applications Option I Background Iterations

Option II

Option II

Allow all possible sub-computation calls, even if the tree of sub-computations is ill-founded, and consider only those for which the tree of sub-computations just so happens to be well-founded. So some legal computations have an undefined result. Still, among those with a defined result, some computations are halting, and some divergent computations have a stable output.

BIG FACT If a real is eventually writable in this fashion, then it's writable.

- 4 回 ト 4 三 ト 4 三 ト

Option I Option II Option III

Results

BIG FACT If a real is eventually writable in this fashion, then it's writable.

Proof.

Given *e*, run the computation of ϕ_e . Keep asking "if I continue running this computation until cell 0 changes, is that computation convergent or divergent?" Eventually you will get "divergent" as your answer. Then go on to cell 1, then cell 2, etc. After going through all the natural numbers, you know the real on your output tape is the eventually writable real you want. So halt.

QUESTION

Why isn't this a contradiction? Why can't you diagonalize? $\ensuremath{\mathsf{ANSWER}}$

You can't run a universal machine.

As soon as a machine with code for a universal machine makes an ill-founded sub-computation call, it freezes.

Definition

R is **freezingly writable** if R appears anytime during such a computation, even if that computation later freezes.

<u>Claim</u> In order to understand the writable reals in this context, one needs to understand the freezingly writable reals. One also needs to understand the tree of sub-computations for freezing computations.

Yet another option: parallel computation:

An oracle call may be the question "does one of these computations converge?" The computation asked about has an index e, parameter x, and free variable n. If one (natural number) value for n yields a convergent computation, the answer is "yes", even if other values yield freezing computations. The answer "yes" means some natural number yields a convergent computation, even if other numbers yield freezing. The answer "no" means all parameter values yield non-freezing computations and all are divergent.
