

From Dyck paths colored by connected matchings to standard Young tableau

Michael D. Weiner, Penn State Altoona

We show a bijection between the set of Dyck paths with ascents of length m colored by connected perfect matchings on $[m]$ that avoid 4-crossings, and the set of standard Young tableau of height less than or equal to seven. Using partial Bell polynomials we give a formula for the number of elements in the set and discuss possible generalizations.

Keywords: Dyck paths, standard Young tableau, partial Bell polynomials
