

## **$\mathcal{P}$ -positions in Halve Nim**

Stephen Locke, Florida Atlantic University

Richard Low, San Jose State University

Stephen Curran\*, University of Pittsburgh at Johnstown

We investigate a variant of Nim, which in addition to the standard moves of Nim, we allow replacing each pile of coins with half its amount. We determine all of the  $\mathcal{P}$ -positions for two-pile games. In addition, among all games in which the height of each pile is at most four, we characterize the games that are  $\mathcal{P}$ -positions.

Keywords: Combinatorial game theory, Nim
