On z-cycle factorizations with two associate classes where z is $2a$ and a is even

Joshua Lambert, Michael Tiemeyer*, Georgia Southern University

Let $K = K(a, p; \lambda_1, \lambda_2)$ be the multigraph with: the number of vertices in each part equal to a; the number of parts equal to p; the number of edges joining any two vertices of the same part equal to λ_1; and the number of edges joining any two vertices of different parts equal to λ_2. The existence of C_4-factorizations of K has been settled when a is even; when $a \equiv 1 \pmod 4$ with one exception; and for very few cases when $a \equiv 3 \pmod 4$. The existence of C_z-factorizations of K has been settled when $a \equiv 1 \pmod z$ and λ_1 is even, and when $a \equiv 0 \pmod z$. In this paper, we give a construction for C_z-factorizations of K for $z = 2a$ when a is even.
